Dear Aircall hiring team,

I am writing about the Forward Deployed Engineer (AI Solutions) role for the NA West market, based in San Francisco. For three years I have run discovery with a customer's operating team, built the integration, and stayed until they could run it. I live in Emeryville, so the San Francisco office days are a commute I can make.

The work I want is the one in your posting: connect the AI Voice Agent to the CRM and help desk a business already uses, with intents, prompts, actions, and guardrails defined on purpose. I build so a person stays the decision-maker. I will also say the gaps. I have not administered Salesforce Flow or HubSpot Workflows, and I have not run outbound campaigns against an installed base. I integrate through REST, webhooks, and n8n, and I have sold my own book of work rather than a regional pipeline target.

How that maps to the delivery:

- **Discovery to a deployed workflow:** I map the process, write the spec, and ship the automation in n8n and Python. An MSP pre-sales assessment fell 98% in processing time, and their team now extends it.
- **Agent configuration:** prompts, review gates, and a numeric bar. One evaluation had to hit 95% agreement with human reviewers. Claude Code is how I iterate those workflows with the customer.
- **Playbooks and enablement:** EZ-AI is the workshop I run so operators can judge the output after I leave. The second deployment should start from the first, not from zero.

Thank you for your time and consideration. I would welcome a conversation about which customer workflows you want in production first.

Sincerely,

Ethan Zaruba-Walker
