Dear Hippocratic AI hiring team,

I am writing about the Sales Engineer role in Menlo Park. The posting describes a lighter-weight forward deployed engineer: prototype the agent flow, then walk into the room and explain it. That is the work I already do. I live in Emeryville and can be in the Menlo Park office five days a week.

Your framing is a safety-focused healthcare LLM, and the demos have to survive a clinical and a commercial audience. I will not pretend I have run a pharma sales cycle. What I have done is make an AI output checkable. At Valhalla I turned handwritten clinical notes into a data model (F1 80.03), with a person still reviewing the result. In my own practice I hold an evaluation to 95% agreement with human reviewers before I treat the score as real.

How I would show up in a cycle:

- **Discovery, then a proof:** I scope the workflow with the operator, write the engagement down, and build the prototype in Python against Claude, OpenAI, or Gemini APIs. Claude Code is the tool I use to iterate the demo.
- **The room:** at IBM I wrote the release notes and presented operational results to C-level readers. The same explanation has to work for an engineer and for someone who will never open the repo.
- **Degree:** B.S. Information Science, Major GPA 3.7, plus a Cognitive Science certificate. That is a related technical field, not a computer science degree.

Thank you for your time and consideration. I would welcome the chance to walk through a proof of concept the way I would run one with a prospect.

Sincerely,

Ethan Zaruba-Walker
