Dear Noah Adelstein,

I am writing about the GTM Engineer role in San Francisco. The posting asks for a two-minute video of something I have built, sent to noah@netic.ai. I will send that separately. This letter is the written half: I build the system a team sells with, and I have also been the person selling it.

Netic's site describes an AI revenue engine for essential-service businesses, with agents that book jobs into the CRM or field-service system the company already runs. That is the class of workflow I take on. I have not held a RevOps or MarketingOps title, and I have not built a TAM database. The three years are founder delivery at StaffRoom AI: I owned the number, chose what to automate, and wrote the code.

What I would build in the seat:

- **Internal tools the sellers will use:** discovery notes, scopes, and n8n workflows, in Python and SQL. Claude Code is how I iterate them. One pre-sales assessment fell 98% in processing time.
- **Usage into the next action:** an agency content system increased production volume 10x once operators could see what was stuck. At IBM I built the dashboards that showed which issues repeated.
- **The same motion for a customer:** I read the conversations, name the repeated job, and leave a workflow plus training (EZ-AI) so the team can run it without me.

Thank you for your time and consideration. I would welcome a working session on which signal or internal tool you want stood up first.

Sincerely,

Ethan Zaruba-Walker
