Dear Hiring Manager,

I am applying for the Business Analyst role on your product team. Since October 2023 at StaffRoom AI I have run client work from discovery interviews and current-state process diagrams through a written specification, a pilot, user training, and the backlog after launch. People stay the final firewall for accuracy. That is how I decide a workflow is done, and it is the rule Makai publishes.

Your published case studies start from documents people already handle: medical forms, bank statements, and fund subscription agreements. My closest proof is handwritten clinical notes turned into a structured data model. I would map the current workflow, fit your pre-built components to it, and carry the pilot and the training beside your engineers and product managers. When the early vision needs a prototype, I build a thin slice in Python, n8n, and Claude Code so representative users can try it.

How I would contribute:

- **Discovery and process diagrams:** For an IT managed-service provider I mapped the pre-sales risk assessment, including the files, data, and systems each step used, then trained that team to run it. Processing time fell 98%.
- **Specifications and testing:** I write the specification as a statement of work: target workflow, source data, and milestone acceptance criteria. A content-scoring workflow had to reach 95% agreement with human reviewers before production.
- **Training:** Discovery, workflow design, and operator training on an agency content system raised production volume 10x.

I have not used process-mining tools, Jira, or Azure DevOps. I have BPMN from IBM's Systems and Solutions Architecture coursework (April 2026), and I track milestones in GitHub. Thank you for your time and consideration. I would welcome a conversation about how your analysts run the first weeks of a new client engagement.

Sincerely,

Ethan Zaruba-Walker
