Dear Gumloop hiring team,

I am applying for the Forward Deployed Agentic Engineer role on the Customer Success team in San Francisco. For three years I have owned delivery after the contract is signed: map the process with the operators, connect the systems, ship the agent past a prototype, and stay until they can keep building without me. I live in Emeryville, so the San Francisco office is a commute I can make, and customer travel up to about 30% fits a Bay Area base.

The people who know the work should be able to automate it. I already do that, with the operator as the decision-maker. I would do it inside your model: IT controls access, data, and spend, and the whole team can use what one group builds. I would scope the high-value opportunity with operators and executives, including when the spec is still incomplete, and judge success by adoption and business impact. The pattern goes to Product, Engineering, Customer Success, and Education. This is an early seat, and part of the work is defining how that partnership runs.

How that maps to the seat:

- **Discovery to deployment:** map the process, connect the systems, structure the customer's data, and train the team that owns the workflow. I did that on an IT MSP's pre-sales risk assessments. Processing time fell 98%. That is how I would take the first agent live on a new account.
- **Build and debug in the field:** TypeScript, JSON, Git, and CI against live APIs, with MCP servers and production LLM workflows on Claude, OpenAI, and Gemini. Claude Code is the daily driver. The Notion integrations are the proof that stack has already shipped past a prototype.
- **Adoption and business impact:** train the operators to own the workflow, then measure the change. Production volume on a content system rose 10x after that handoff.

One gap, named plainly. My engagements have run up to $18K, not a Gusto-sized enterprise rollout. The motion is the same: process map, connected systems, structured customer data, and a team that can keep building after I leave. I will be explicit about scale while I ramp on your largest accounts.

Thank you for your time and consideration. I would welcome the chance to talk about which customer deployment should become the reusable pattern first.

Sincerely,

Ethan Zaruba-Walker
