Dear Notion hiring team,

I am writing about the Forward Deployed Engineer, GTM, AMER role on Notion's Services team. For three years I have been the engineer inside my own customer work: discovery, scoping, production code, and a handoff the team can run. Much of that work is on Notion: a public OAuth Connections app and Claude Code against Notion's hosted MCP as a daily driver. Notion's GTM motion is now about building systems with customers so the product can sit as the operating layer of the business. I live in Emeryville, so hybrid in San Francisco is a short commute.

How I would take that on:

- **Notion platform:** production TypeScript and Python against the Notion API, including OAuth, data sources, and CI that tests live API connectivity. I build MCP servers and use Claude Code daily.
- **Embedded delivery:** I automated an IT MSP's pre-sales risk assessments, cut processing time 98%, then trained the team to extend the workflow. A Notion content system I designed increased agency production volume 10x.
- **Pipelines and reusable assets:** I modernized an ingestion pipeline (throughput +99.8% in four months, cost -86%) and published an OAuth quickstart, a sample Worker, and a written path through the 2025 data-sources API migration.

The posting asks for 5+ years in a customer-facing or forward-deployed seat. I have three years of founder consulting plus two years building tools inside IBM Customer Support, not five years with an FDE title. My engagements have been up to \$18K, not Fortune-scale migrations, and I have not carried a quota. The loop is the same. The scale is the ramp.

Thank you for your time and consideration. I would welcome the chance to walk through how you currently scope a first production integration for an AMER account.

Sincerely,

Ethan Zaruba-Walker
