Dear Aircall hiring team,

I am writing about the Forward Deployed Engineer role on the AI Solutions Engineering team in San Francisco. For three years I have been the only technical person on my own engagements: I run discovery with a customer's operating team, build the integration, and stay until they can run it without me. That is the loop your posting describes, and I am in Emeryville, so the office days are a short commute.

Turning possibility into production is the part of this work I find genuinely worth doing. Aircall has spent this year deepening its stack, acquiring Vogent in May and extending autonomous handling to SMS and WhatsApp on the numbers customers already use. Wiring an agent into the CRM and help desk a business already runs on is where those deployments are won or lost, and I build so the person stays the decision-maker.

How that maps to what you need:

- **APIs and integrations:** production REST/JSON work including a public OAuth app built for multi-customer install and CI that tests live third-party API connectivity. Your developer platform connects tools and data to Aircall's AI Virtual Agents through MCP; I build and run MCP servers today, with Claude Code as a daily driver.
- **Low-code orchestration into enablement:** n8n automations handed to non-technical teams as their daily tools. I automated an IT MSP's pre-sales risk assessments, cut processing time 98%, then trained their team to keep extending it. Every engagement since has run on the same discovery-to-handover playbook, the basis for reusable templates and reference architectures.
- **Customer support as a domain:** two years inside IBM's support organization, where I shipped DRE Bot, a Watson NLP Slack app that cut the most common issues from a multi-touch case to a single response.
- **Revenue, not only delivery:** for three years I have sourced my own pipeline, scoped and priced the work, and owned the result. Not a regional quota, but the entire number for my own business.

One real gap, named plainly: my low-code orchestration is in n8n, one of the four platforms you list, not HubSpot Workflows or Salesforce Flow. Those CRM-native builders are new to me; the API layer underneath them is not, and that is the part that takes longer.

Thank you for your time and consideration. I would welcome the chance to talk about which AI Actions your SMB customers turn on first.

Sincerely,

Ethan Zaruba-Walker
